

# Dynamic Euclid: Using GeoGebra to Construct and Present Geometric Proofs

Jeff Hall

Mercer University

# Proof vs. Verification

“A proof is a theoretical confirmation that a statement (for example, ‘the bisector lines of a triangle are concurrent’) is always true.

A verification is usually an experiment, that the statement is indeed true, by choosing a large set of examples.”

- Zoltán Kovács (2012, para. 2)

“At the age of 12 I experienced a second wonder of a totally different nature in a little book dealing with Euclidean plane geometry....

Here were assertions, as for example, the intersection of the three altitudes of a triangle in one point, which – though by no means evident – could nevertheless be proved with such certainty that any doubt appeared out of the question.”

- Albert Einstein

(as cited in Sagan, 1979, p. 20)

# Proofs in GeoGebra

- “Are” commands

AreEqual[ <Object>, <Object> ]

AreCollinear[ <Point>, <Point>, <Point> ]

AreConcurrent[ <Line>, <Line>, <Line> ]

AreConcyclic[ <Point>, <Point>, <Point>, <Point> ]

AreParallel[ <Line>, <Line> ]

ArePerpendicular[ <Line>, <Line> ]

– Numerical calculation verification

# Proofs in GeoGebra

- “Prove” command

Prove[ <Boolean Expression> ]

- Uses symbolic methods, not numeric computations
- Determine “true” or “false” in general
  - Yields “true” if a statement is always true
  - Yields “false” if a statement is not always true
- More information:  
[http://wiki.geogebra.org/en/Prove\\_Command](http://wiki.geogebra.org/en/Prove_Command)

# Proofs in GeoGebra

- “ProveDetails” command

ProveDetails[ <Boolean Expression> ]

- Uses symbolic methods
- Lists non-degenerate conditions
- More information:  
[http://wiki.geogebra.org/en/ProveDetails\\_Command](http://wiki.geogebra.org/en/ProveDetails_Command)

# Classroom Ideas

Ask students to explore the GeoGebra proof commands

The screenshot shows the GeoGebra interface with a file named "Proving collinear points.ggb". The menu bar includes File, Edit, View, Options, Tools, Window, and Help. The toolbar contains various geometric construction tools. The left sidebar is divided into Algebra and Graphics views.

**Algebra View:**

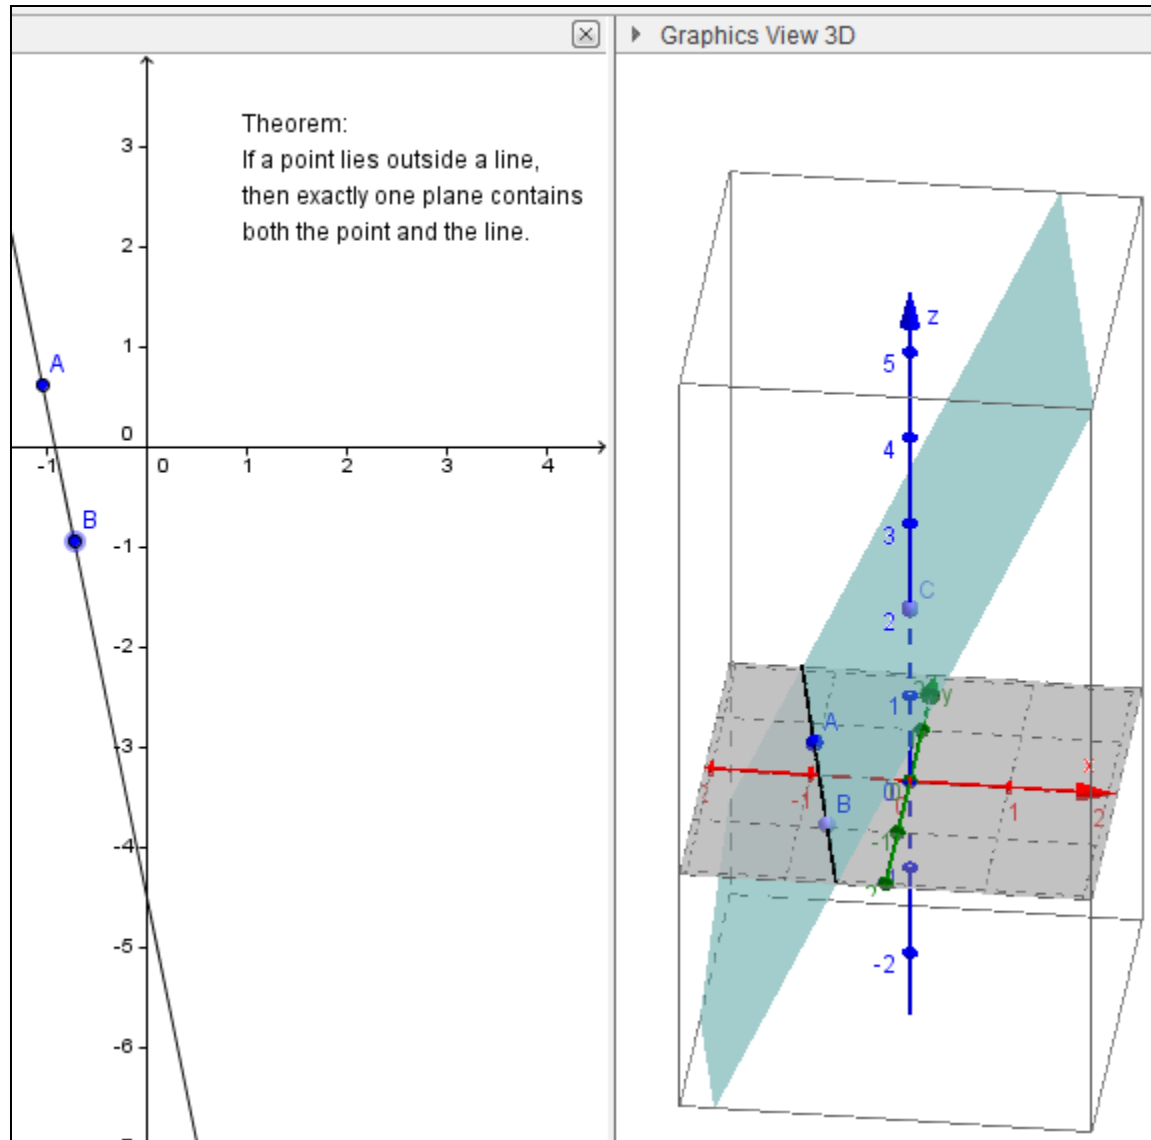

- Boolean Value
  - AreCollinearABC = false
  - AreCollinearABD = true
  - ProveAreCollinearABC = false
  - ProveAreCollinearABD = true
- Line
  - a:  $y = 1$
- List
  - ProveDetailsAreCollinearABC =
  - ProveDetailsAreCollinearABD =
- Point
  - A = (1, 1)
  - B = (6, 1)
  - C = (2, 2)
  - D = (4.28, 1)

**Graphics View:**

The graphics view shows a coordinate grid with a horizontal line  $y = 1$ . Points A, B, and D are located on this line. Point C is located at (2, 2). The points are labeled with blue text.

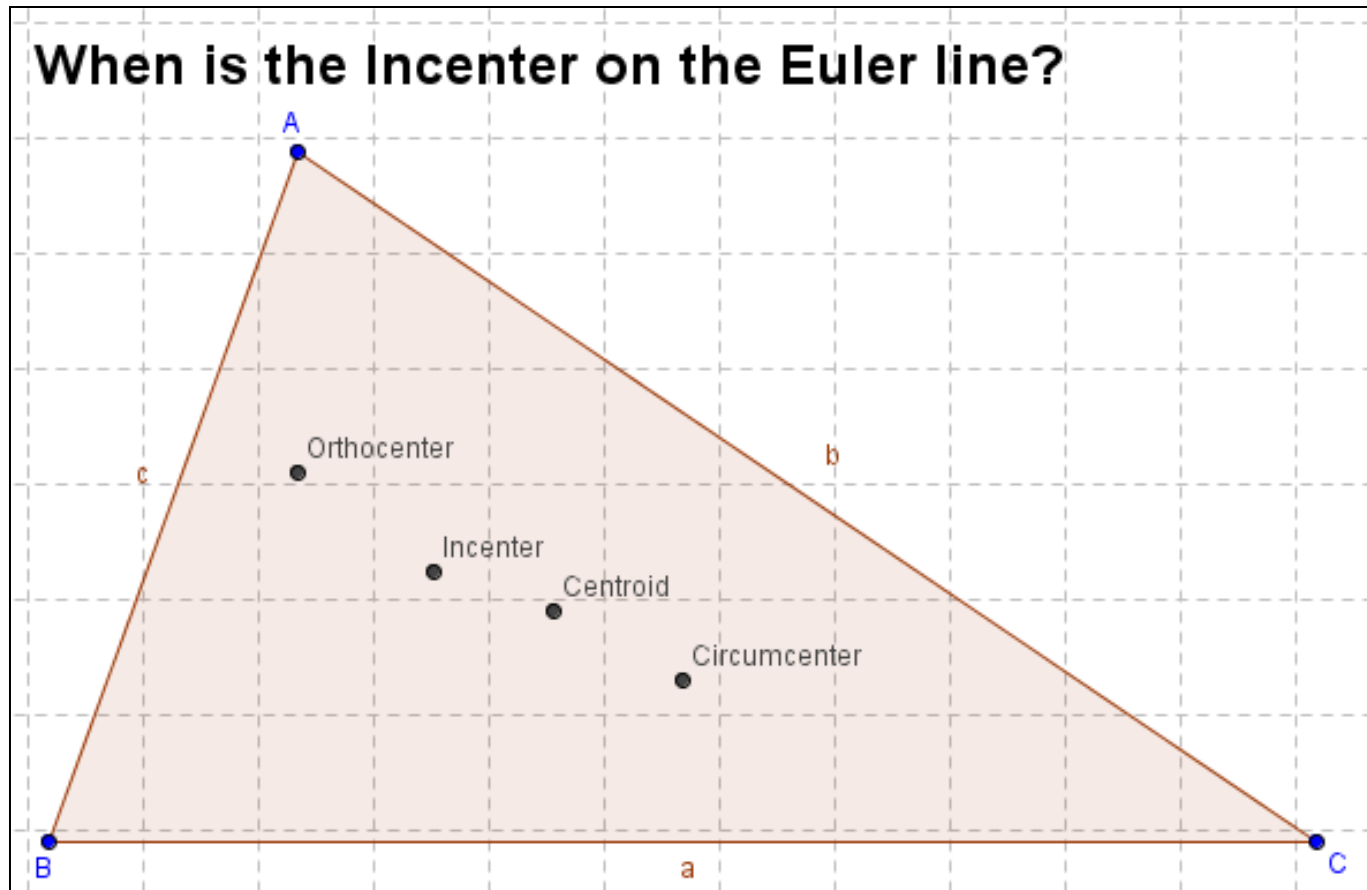

# Classroom Ideas

Ask students to construct figures to demonstrate theorems

# Classroom Ideas

Construct and investigate the properties of the Euler line

# Classroom Ideas

- Ask students to construct a given figure using only Euclidean tools
  - For example, students can try to match the figure produced by GeoGebra's "incircle" command

# Wake 's Geogebra Applets

This website is geared towards the curriculum of high school math (specifically ML) and has Geogebra applets for most of the important theorems and concepts in a high school geometry class. Have fun looking around and enjoy your time!!!
