Motivation

- How I got started with the Mandelbrot Fractal
- Why I use the Mandelbrot Fractal as a teaching tool in PreCalculus

What topics are addressed?

- Complex numbers
- Arithmetic with Complex numbers
- Complex plane and Argand diagrams
- Recursive sequences
- Polar Form of Complex numbers
- Graphing using the Polar plane
- DeMoivre's Theorem

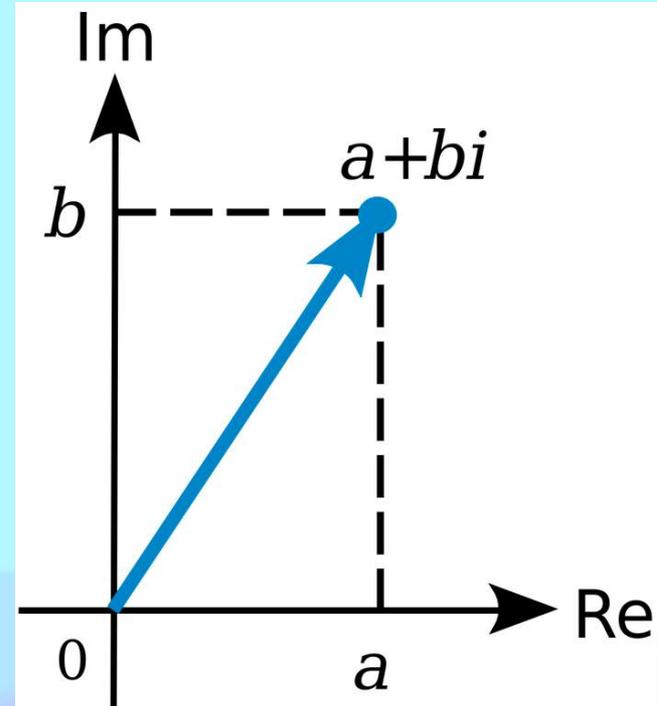

(Presenter hat) Administrivia

How do you use these materials with a class?

This is approximately 3-4 days of material. I wouldn't use an accelerated presentation like this; I'd make sure that the students are active for each step, trying out examples and doing a whole bunch of thinking/talking/calculating (in that order).

Start with the Basics - Complex Numbers

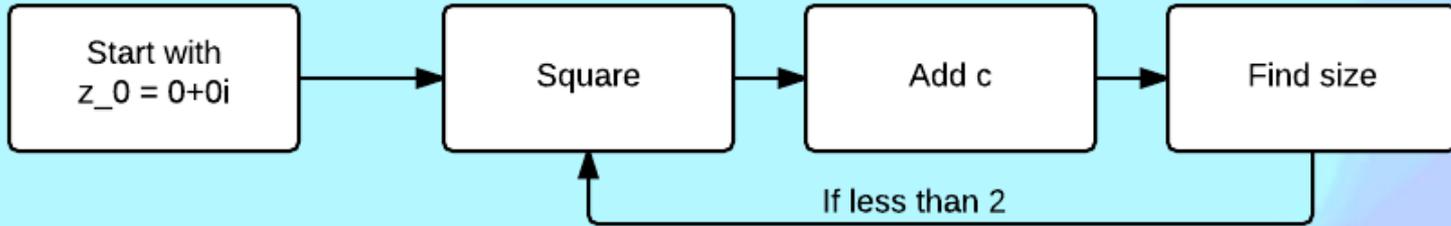

- The complex plane is a modified Cartesian plane, where the *real* part of a complex number is graphed on the x-axis and the *imaginary* part is graphed on the y-axis.
- What is the size (modulus) of $a+bi$?

[Diagram from Wikipedia](#)

The Mandelbrot Set - Definition

- The Mandelbrot set is defined as the set of all complex numbers, c , where the following (infinite) task is **bounded** (the size doesn't "blow up").

- All points who are bounded (size < 2) are in the set, otherwise the point is out of the set.

Next step

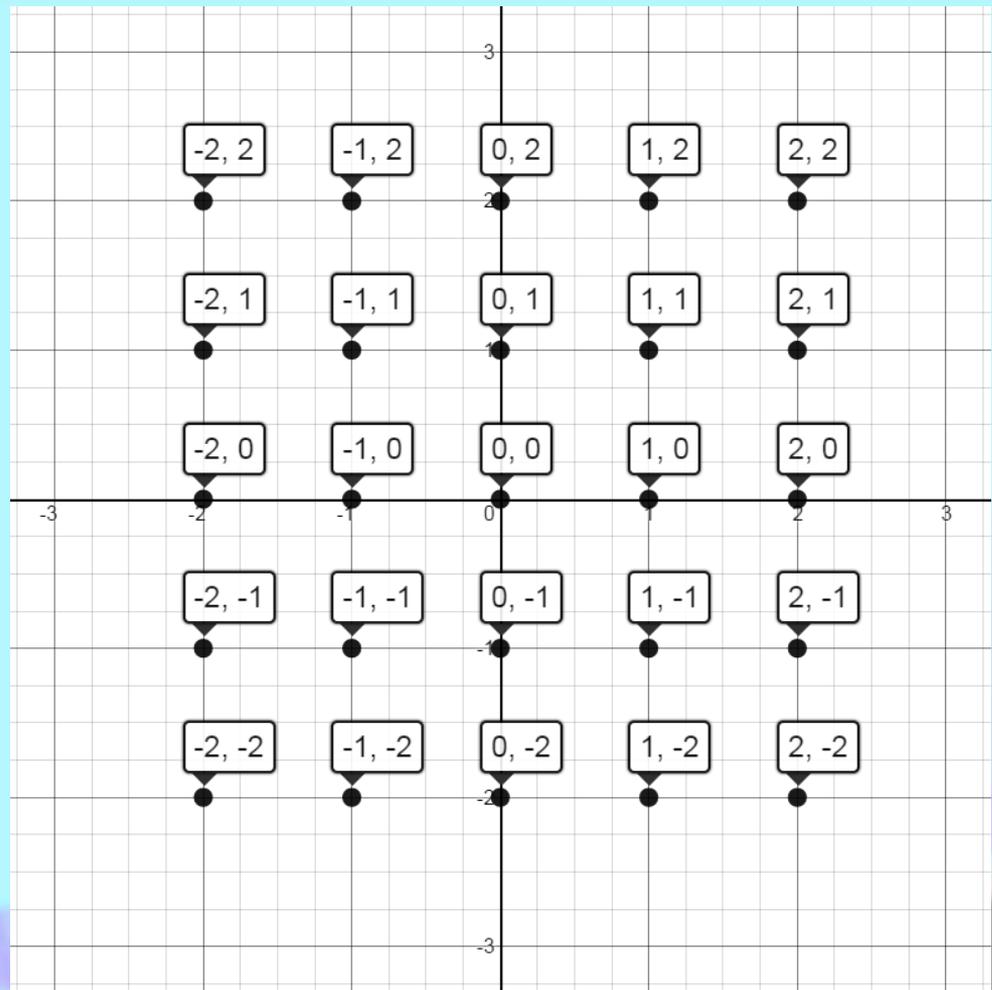

- What points are interesting?
- Is $c = 5+12i$ interesting in this context?
 - $z_0 = 0 + 0i$ -> size of 0, continue
 - $z_1 = (z_0)^2 + c = (0+0i)^2 + (5 + 12i)$ -> size of 13 (out of set)

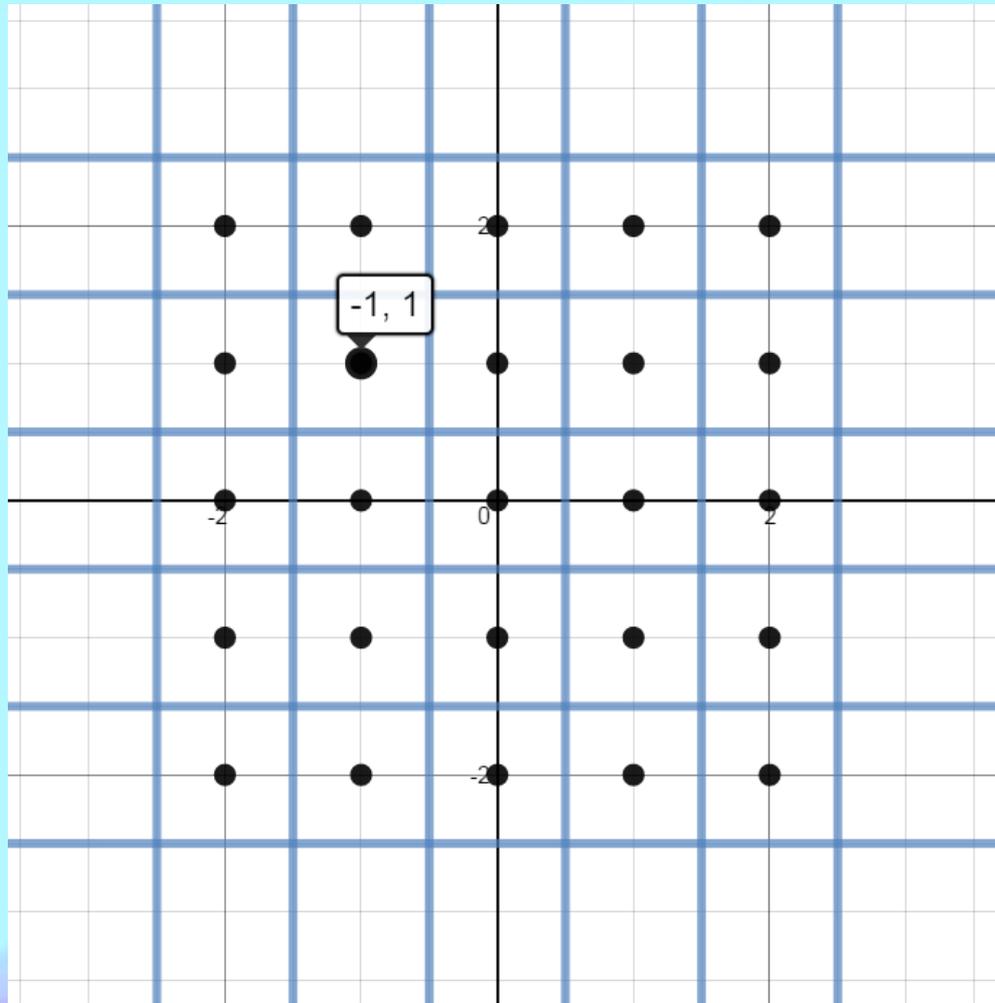

So what points do we have to check?

Let's consider
the
following points:

We'll interpret
each of these
points as a
square.

*Note: $(-2,1)$ represents
 $-2 + 1i$ on the Argand
Plane*

(Teacher hat)

Have the kids do some work

Assign each student a constant (there are 25 to handle).

If you have less than 25 students, you can assign the leftovers later.

(Presenter hat)

Your Turn

You'll be assigned a constant based on what day of the month you were born.

Yes, *you* will be doing some calculations!

[There is a clicker app to keep track of the results on the resources page.](#)

(Teacher) Work through a c together

Especially for reluctant learners, it can help to build confidence by working through an example together.

Take $1+0i$ and reassign the student(s) that had that as their constant.

$1+0i$

- $z_0 = 0 + 0i \rightarrow$ Size is 0, so continue process
- $z_1 = (z_0)^2 + c = (0+0i)^2+(1+0i) = 1+0i \rightarrow$ Size is 1, continue process
- $z_2 = (z_1)^2 + c = (1+0i)^2+(1+0i) = 2+0i \rightarrow$ Size = 2 which is not <2 so process **stops** at the 2nd step. The "escape velocity" is **2**.

Now it's your turn to do some math

- Take your constant and calculate z_1
- Then find the size (magnitude) of z_1 .
- If it's less than 2,
 - then your square is black,
 - else your square is white (outside mandelbrot set).

(Teacher hat) For those who finish early, what shape should this have? Why?

Next Step

- *Note: If your c is out already, pick a different square and start verifying people's answers.*
- Calculate z_2 (from your z_1 and your c).
Size? In Mandelbrot set?
- Calculate z_3 (from z_2 and your c).
Size? In Mandelbrot set?

Step 4+

- Calculate $|z_4|$
- z_5 ?
- Infinite process right? Are we getting a better picture?

(Teacher hat)

How do we make this better?

How can we improve the picture?

How do we make this automatic?

- The computer programming languages don't know about complex numbers. Can you teach them how to square a complex number?
- What are the **Real** and **Imaginary** portions of $(a+bi)^2$?
- You tell me! Expand and separate.

Automatic - Mandelblocks Program

[The Mandelblocks program is linked on the resources page.](#)

- First jump into the code to show where the $(a+bi)^2$ code is.
- Talk about coloring mode
- How can we do even better?

Mandelbrot Program

Treat each pixel as a coordinate on the Complex Plane.

[The Mandelbrot program is linked on the resources page.](#)

- Step 1. A circle? Why??
- Symmetry?

Mandelbrot Zoom

We can do better, let's zoom in and see the detail.

[The Mandelbrot Zoom program is linked on the resources page.](#)

- Is there a limit to how far we can zoom in?
- Note the window width as we zoom.
- Note the resolution required as we zoom in.

What's next?

- How can we expand on this Mandelbrot set?
- What if we consider $z_{(n+1)} = z_n^3 + c$? How will cubing the number change the picture of the set?
- Time for you to get to work and expand $(a+bi)^3$ and separate the real and imaginary parts.

[Let's put in the code and see the fractal!](#)

What's next continued?

What about $z_{n+1} = z_n^4 + c$?

Fifth power?

Sixth power?

Tenth power? (Binomial Expansion right?)

3/2 power? What does that even mean in this context?

Polar to the rescue!

If we convert from rectangular coordinates to polar coordinates then we can find the general solution for *any* power of z_n !

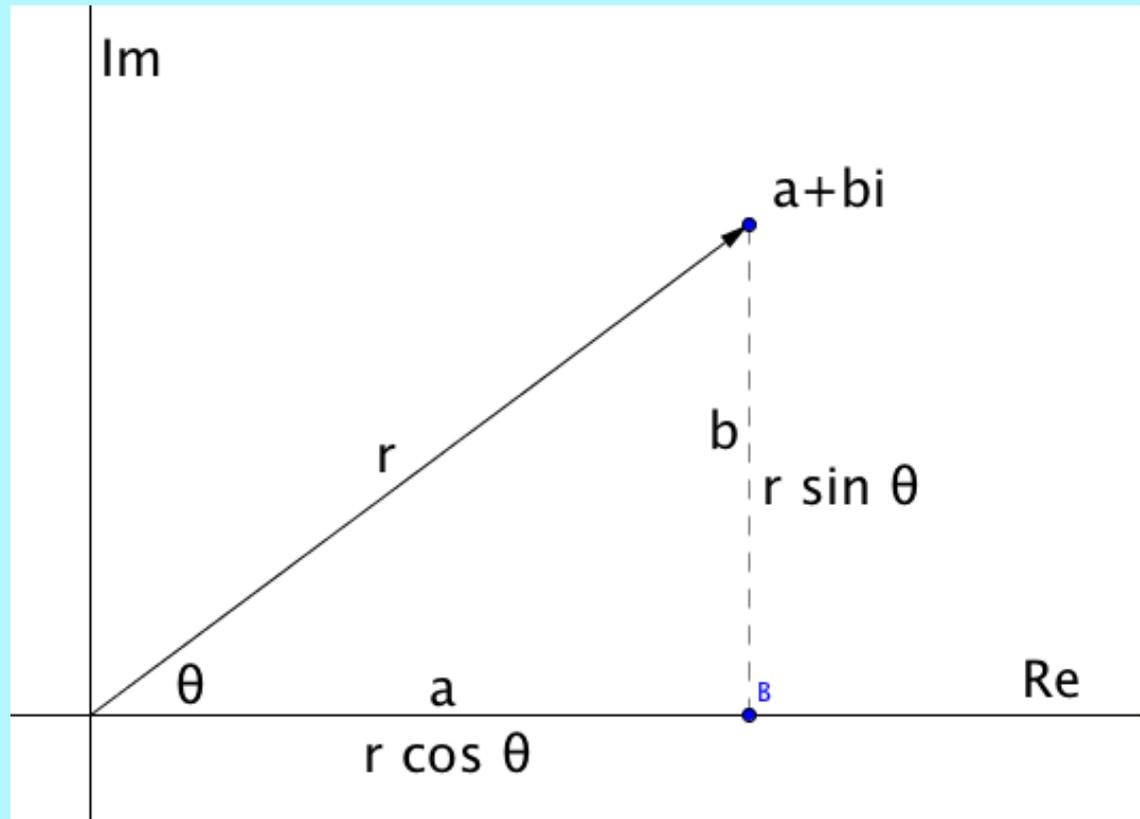

Polar Form

$$a = r \cos(\theta)$$

$$b = r \sin(\theta)$$

so

$$a + bi = r \cos(\theta) + r \sin(\theta) i = r \operatorname{cis}(\theta)$$

Why Polar Form?

deMoivre's Theorem!

$$(a + bi)^n = (r \operatorname{cis} \theta)^n = r^n \operatorname{cis}(n\theta)$$

The math is so much easier, operations with real numbers instead of binomial expansion. *And n doesn't have to be an integer!*

So:

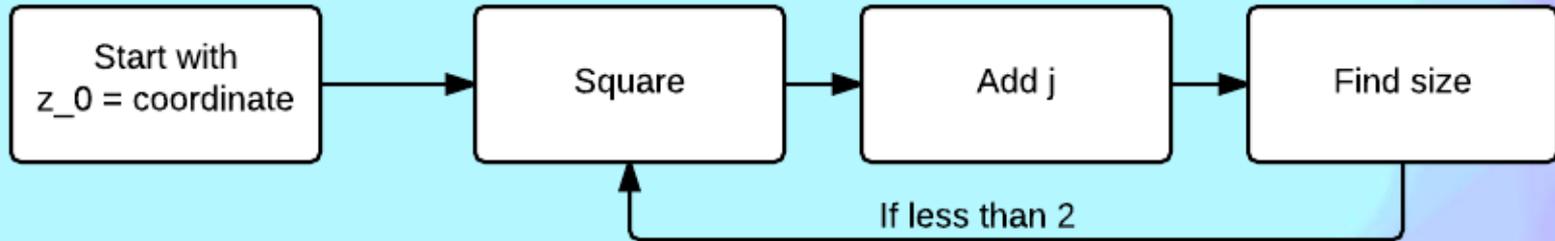

- Convert from rectangular to polar
- Use deMoivre's Theorem
- Convert back to rectangular

Mandelbrot Family Interactive

[The Mandelbrot Family program is linked on the resources page.](#)

Extensions: Julia Set

Let's consider the following rule (Julia Set).
Start with a complex constant j .

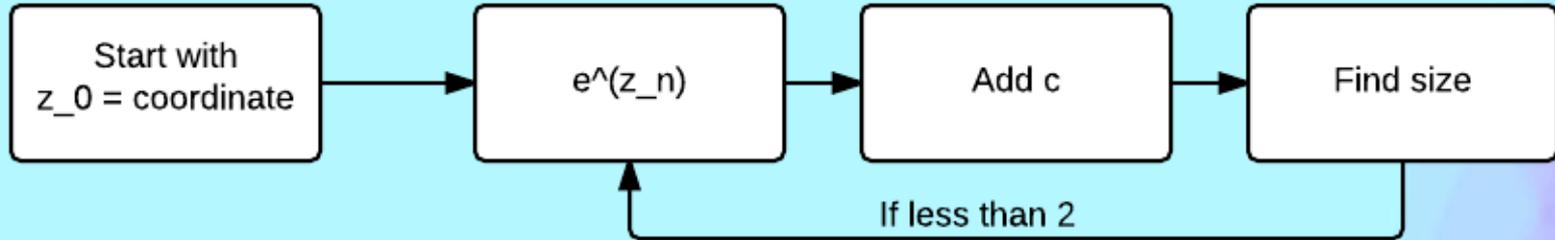

Julia Set Interactive

[The Julia Set program is linked on the resources page.](#)

How are the Julia and Mandelbrot Sets related? [drawMandelbrotAndJulia program is also linked on resources page.](#)

Experimental

What if you consider the following rule?

[The Experimental program is linked on the resources page.](#)

Questions? and Thanks!

A large, faint Mandelbrot fractal is visible in the background, rendered in shades of purple and blue. It features the characteristic self-similar, intricate patterns of a fractal, with a prominent bulbous shape on the right side and a smaller, more complex structure below it.
